The US Machinegun Armory debuts the only semi-auto M249/Mk46 weapon system.

Phoenix, Arizona (December 2, 2009)

At this year's SAR show in Phoenix, the US Machinegun Armory unveiled its new semi-auto M249 and Mk46 belt-fed weapon system.

Though similar to the current military M249s and Mk46s produced primarily by FN, the US Machinegun Armory has created a weapon system that looks like the M249/Mk46 but uses an H&K trigger pack and fires in the closed bolt position using a hammer and firing pin.

The US Machinegun Armory weapon, called the MGA Mk46 SAW, uses most external Milspec accessories such as barrels, top covers, picatinny rails, etc. While the SAW moniker stands for "Squad Automatic Weapon" in the military, the SAW designation for this new weapon stands for "Semi Auto Weapon."

No other company has ever before married the FN-style machineguns with the H&K trigger packs to produce these semi-auto weapons and the US Machinegun Armory is in the process of patenting the design and process.

A Mk46 for civilians!

Now civilians can own one of the most modern military weapons ever made.

But the US Machinegun Armory, whose primary business lies in the Defense market, has capped production at only 30 units of this model for civilian sale.
